

Chapter 5 : Intermediate SQL

Outline

- Join Expressions
- Views
- Transactions
- Integrity Constraints
- SQL Data Types and Schemas
- Index Definition in SQL
- Authorization

Joined Relations

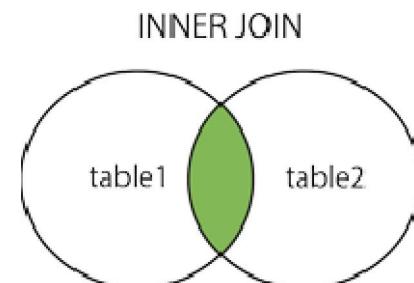

- **Join operations** take two relations and return as a result another relation.
- A join operation is a Cartesian product which requires that tuples in the two relations match (under some condition). It also specifies the attributes that are present in the result of the join

Joined Relations

- **Join operations** take two relations and return as a result another relation.
- A join operation is a Cartesian product which requires that tuples in the two relations match (under some condition). It also specifies the attributes that are present in the result of the join
- The join operations are typically used as subquery expressions in the **from** clause
- Three types of joins:
 - Natural join
 - Inner join
 - Outer join

Natural Join in SQL

- Natural join matches tuples with the same values for all common attributes, and retains only one copy of each common column.
- List the names of instructors along with the course ID of the courses that they taught
 - `select name, course_id
from students, takes
where student.ID = takes.ID;`
- Same query in SQL with “natural join” construct
 - `select name, course_id
from student natural join takes;`

An example of SQL semantics

Lecture 2 > Section 3 > Joins: semantics

R	A
1	1
3	3

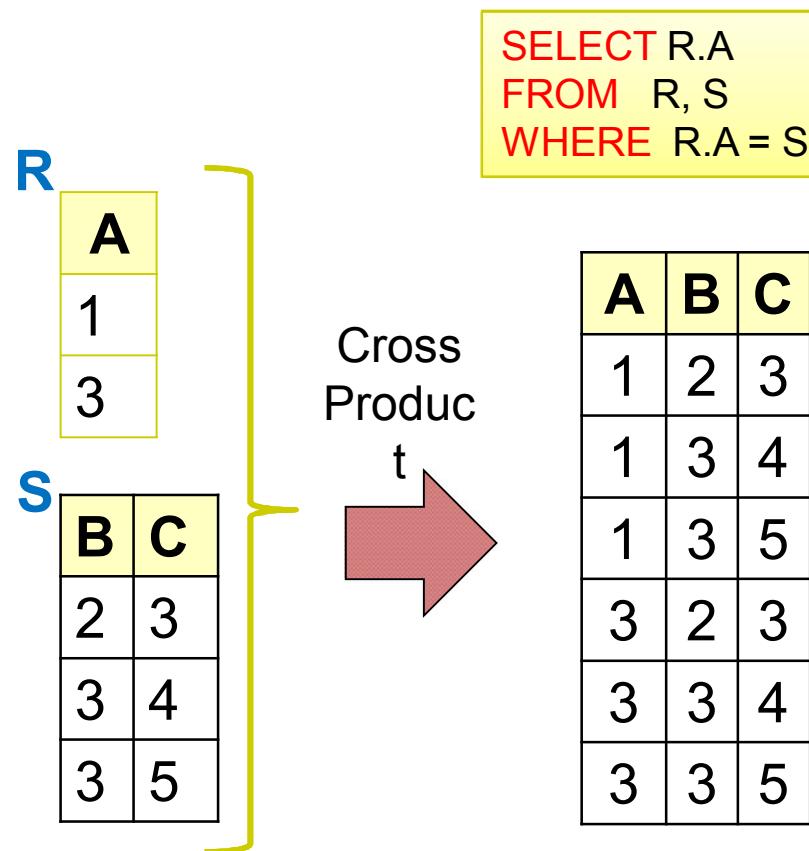

```
SELECT R.A  
FROM R, S  
WHERE R.A = S.B
```

S	B	C
2	3	
3	4	
3	5	

5 / 36

An example of SQL semantics

An example of SQL semantics

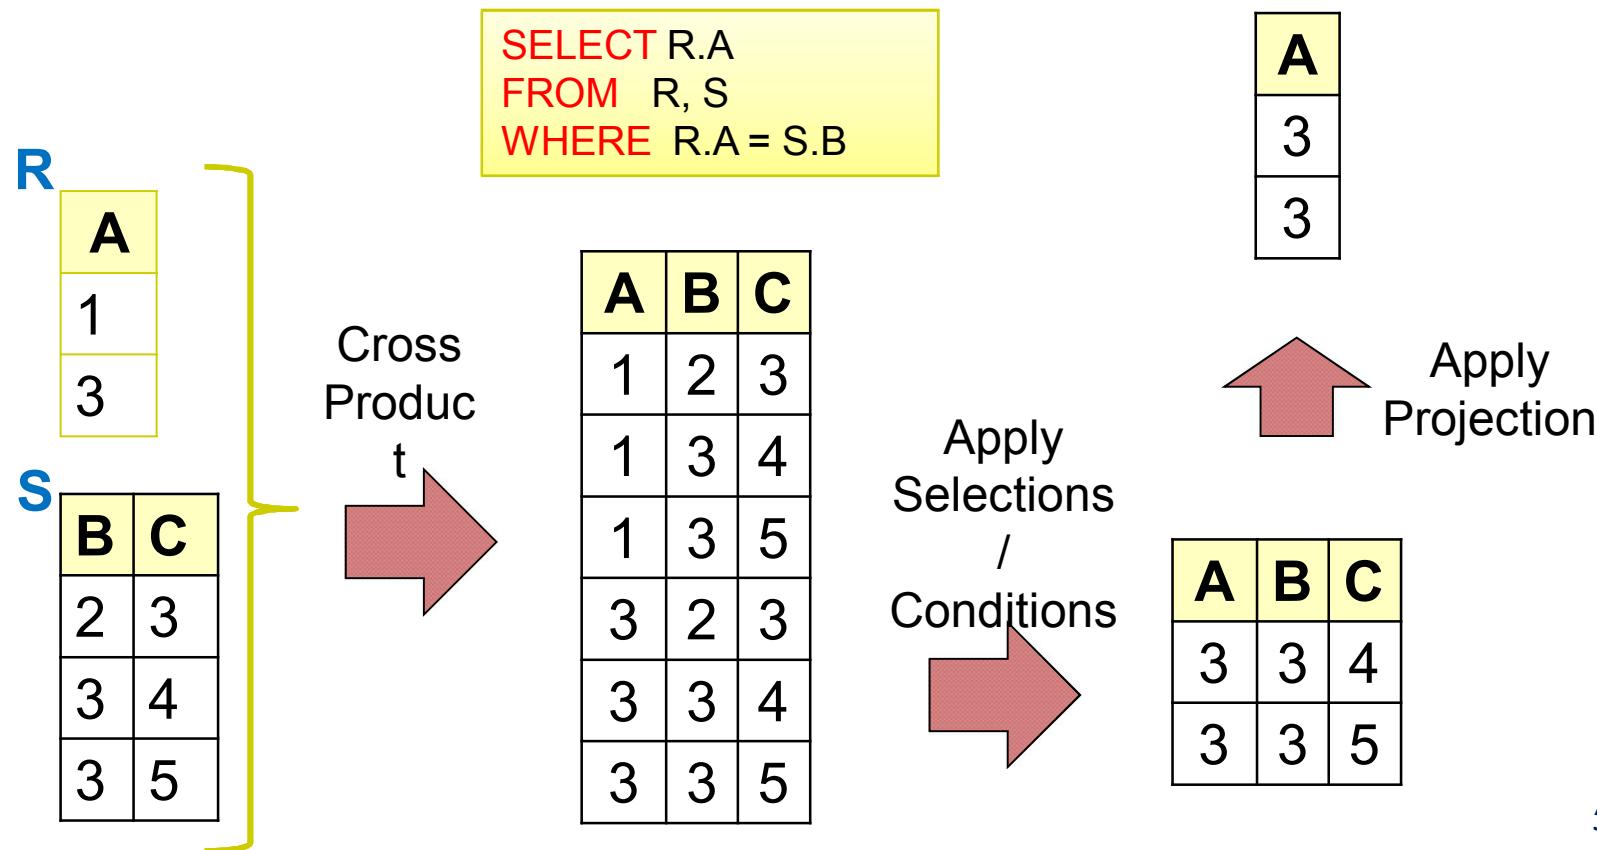

Lecture 2 > Section 3 > Joins: semantics

5 / 36

Natural Join in SQL (Cont.)

- The **from** clause can have multiple relations combined using natural join:

```
select A1, A2, ... An  
from r1 natural join r2 natural join .. natural join rn  
where P;
```

Student Relation

Outer Join

- An extension of the join operation that avoids loss of information.
- Computes the join and then adds tuples from one relation that does not match tuples in the other relation to the result of the join.

Outer Join

- An extension of the join operation that avoids loss of information.
- Computes the join and then adds tuples from one relation that does not match tuples in the other relation to the result of the join.
- Three forms of outer join:
 - left outer join
 - right outer join
 - full outer join

Outer Join Examples

- Relation *course*

<i>course_id</i>	<i>title</i>	<i>dept_name</i>	<i>credits</i>
BIO-301	Genetics	Biology	4
CS-190	Game Design	Comp. Sci.	4
CS-315	Robotics	Comp. Sci.	3

- Relation *prereq*

<i>course_id</i>	<i>prereq_id</i>
BIO-301	BIO-101
CS-190	CS-101
CS-347	CS-101

- Observe that

course information is missing CS-347

prereq information is missing CS-315

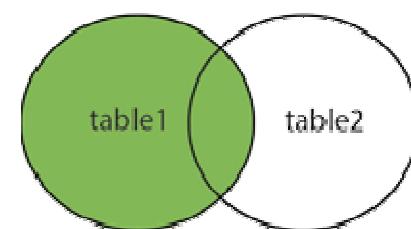

Left Outer Join

- course natural left outer join prereq

course_id	title	dept_name	credits	prereq_id
BIO-301	Genetics	Biology	4	BIO-101
CS-190	Game Design	Comp. Sci.	4	CS-101
CS-315	Robotics	Comp. Sci.	3	null

- In relational algebra: $course \bowtie prereq$

LEFT JOIN

course_id	title	dept_name	credits
BIO-301	Genetics	Biology	4
CS-190	Game Design	Comp. Sci.	4
CS-315	Robotics	Comp. Sci.	3

course_id	prereq_id
BIO-301	BIO-101
CS-190	CS-101
CS-347	CS-101

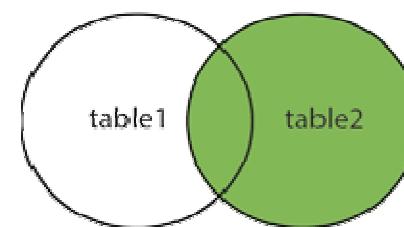

Right Outer Join

- course natural right outer join prereq

course_id	title	dept_name	credits	prereq_id
BIO-301	Genetics	Biology	4	BIO-101
CS-190	Game Design	Comp. Sci.	4	CS-101
CS-347	null	null	null	CS-101

- In relational algebra: $\text{course} \bowtie \text{prereq}$

RIGHT JOIN

course_id	title	dept_name	credits
BIO-301	Genetics	Biology	4
CS-190	Game Design	Comp. Sci.	4
CS-315	Robotics	Comp. Sci.	3

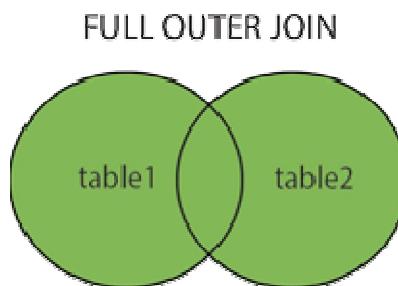

course_id	prereq_id
BIO-301	BIO-101
CS-190	CS-101
CS-347	CS-101

Full Outer Join

- course natural full outer join prereq

course_id	title	dept_name	credits	prereq_id
BIO-301	Genetics	Biology	4	BIO-101
CS-190	Game Design	Comp. Sci.	4	CS-101
CS-315	Robotics	Comp. Sci.	3	null
CS-347	null	null	null	CS-101

- In relational algebra: $course \bowtie prereq$

course_id	title	dept_name	credits
BIO-301	Genetics	Biology	4
CS-190	Game Design	Comp. Sci.	4
CS-315	Robotics	Comp. Sci.	3

course_id	prereq_id
BIO-301	BIO-101
CS-190	CS-101
CS-347	CS-101

Views

- In some cases, it is not desirable for all users to see the entire logical model (that is, all the actual relations stored in the database.)
- Consider a person who needs to know an instructors name and department, but not the salary. This person should see a relation described, in SQL, by

```
select ID, name, dept_name  
from instructor
```

Views

- In some cases, it is not desirable for all users to see the entire logical model (that is, all the actual relations stored in the database.)
- Consider a person who needs to know an instructors name and department, but not the salary. This person should see a relation described, in SQL, by

```
select ID, name, dept_name  
from instructor
```

- A **view** provides a mechanism to hide certain data from the view of certain users.
- Any relation that is not of the conceptual model but is made visible to a user as a “virtual relation” is called a **view**.

View Definition

- A view is defined using the **create view** statement which has the form

create view *v* as < query expression >

where <query expression> is any legal SQL expression.
The view name is represented by *v*.

View Definition

- A view is defined using the **create view** statement which has the form

create view *v* as < query expression >

where <query expression> is any legal SQL expression.
The view name is represented by *v*.

- Once a view is defined, the view name can be used to refer to the virtual relation that the view generates.
- View definition is not the same as creating a new relation by evaluating the query expression

View Definition

- A view is defined using the **create view** statement which has the form

create view *v* as < query expression >

where <query expression> is any legal SQL expression.
The view name is represented by *v*.

- Once a view is defined, the view name can be used to refer to the virtual relation that the view generates.
- View definition is not the same as creating a new relation by evaluating the query expression
 - Rather, a view definition causes the saving of an expression; the expression is substituted into queries using the view.

View Definition and Use

- A view of instructors without their salary

```
create view faculty as  
select ID, name, dept_name  
from instructor
```

<i>ID</i>	<i>name</i>	<i>dept_name</i>	<i>salary</i>

Views Defined Using Other Views

- One view may be used in the expression defining another view
- A view relation v_1 is said to ***depend directly*** on a view relation v_2 if v_2 is used in the expression defining v_1
- A view relation v_1 is said to ***depend on*** view relation v_2 if either v_1 depends directly to v_2 or there is a path of dependencies from v_1 to v_2
- A view relation v is said to be ***recursive*** if it depends on itself.

Views Defined Using Other Views

- **create view *physics_fall_2017* as**
select course.course_id, sec_id, building, room_number
from course, section
where course.course_id = section.course_id
and course.dept_name = 'Physics'
and section.semester = 'Fall'
and section.year = '2017';

Course Table

course_id	title	dept_name	credits
BIO-301	Genetics	Biology	4
CS-190	Game Design	Comp. Sci.	4
CS-315	Robotics	Comp. Sci.	3

Views Defined Using Other Views

- **create view *physics_fall_2017* as**
select course.course_id, sec_id, building, room_number
from course, section
where course.course_id = section.course_id
and course.dept_name = 'Physics'
and section.semester = 'Fall'
and section.year = '2017';
- **create view *physics_fall_2017_watson* as**
select course_id, room_number
from *physics_fall_2017*
where building= 'Watson';

Course Table

course_id	title	dept_name	credits
BIO-301	Genetics	Biology	4
CS-190	Game Design	Comp. Sci.	4
CS-315	Robotics	Comp. Sci.	3

View Expansion

- Expand the view :

```
create view physics_fall_2017_watson as  
select course_id, room_number  
from physics_fall_2017  
where building= 'Watson'
```

- To:

View Expansion

- Expand the view :

```
create view physics_fall_2017_watson as  
select course_id, room_number  
from physics_fall_2017  
where building= 'Watson'
```

- To:

```
create view physics_fall_2017_watson as  
select course_id, room_number  
from (select course.course_id, building, room_number  
      from course, section  
     where course.course_id = section.course_id  
       and course.dept_name = 'Physics'  
       and section.semester = 'Fall'  
       and section.year = '2017')  
  where building= 'Watson';
```

Materialized Views

- Certain database systems allow view relations to be physically stored.
 - Physical copy created when the view is defined.
 - Such views are called **Materialized view**:
- If relations used in the query are updated, the materialized view result becomes out of date
 - Need to **Maintain** the view, by updating the view whenever the underlying relations are updated.

Update of a View

- Add a new tuple to *faculty* view which we defined earlier

insert into faculty

values ('30765', 'Green', 'Music');

- This insertion must be represented by the insertion into the *instructor* relation
 - Must have a value for salary.
- Two approaches
 - Reject the insert
 - Inset the tuple

('30765', 'Green', 'Music', null)

into the *instructor* relation

faculty

(a) The *instructor* table

Some Updates Cannot be Translated Uniquely

- **create view *instructor_info* as**
select *ID*, *name*, *building*
from *instructor*, *department*
where *instructor.dept_name*=
***department.dept_name*;**
- **insert into *instructor_info***
values ('69987', 'White', 'Taylor');
- Issues
 - Which department, if multiple departments in Taylor?
 - What if no department is in Taylor?

<i>ID</i>	<i>name</i>	<i>dept_name</i>	<i>salary</i>
22222	Einstein	Physics	95000
12121	Wu	Finance	90000
32343	El Said	History	60000
45565	Katz	Comp. Sci.	75000
98345	Kim	Elec. Eng.	80000
76766	Crick	Biology	72000
10101	Srinivasan	Comp. Sci.	65000
58583	Califieri	History	62000
83821	Brandt	Comp. Sci.	92000
15151	Mozart	Music	40000
33456	Gold	Physics	87000
76543	Singh	Finance	80000

(a) The *instructor* table

<i>dept_name</i>	<i>building</i>	<i>budget</i>
Comp. Sci.	Taylor	100000
Biology	Watson	90000
Elec. Eng.	Taylor	85000
Music	Packard	80000
Finance	Painter	120000
History	Painter	50000
Physics	Watson	70000

(b) The *department* table

And Some Not at All

- **create view *history_instructors* as**
select *
from *instructor*
where *dept_name*= 'History';
- What happens if we insert
(**'25566', 'Brown', 'Biology', 100000**)
into *history_instructors*?

<i>ID</i>	<i>name</i>	<i>dept_name</i>	<i>salary</i>
22222	Einstein	Physics	95000
12121	Wu	Finance	90000
32343	El Said	History	60000
45565	Katz	Comp. Sci.	75000
98345	Kim	Elec. Eng.	80000
76766	Crick	Biology	72000
10101	Srinivasan	Comp. Sci.	65000
58583	Califieri	History	62000

View Updates in SQL

- Most SQL implementations allow updates only on simple views
 - The **from** clause has only one database relation.
 - The **select** clause contains only attribute names of the relation, and does not have any expressions, aggregates, or **distinct** specification.
 - Any attribute not listed in the **select** clause can be set to null
 - The query does not have a **group by** or **having** clause.

Transactions

- A **transaction** consists of a sequence of query and/or update statements and is a “unit” of work
- The SQL standard specifies that a transaction begins implicitly when an SQL statement is executed.
- The transaction must end with one of the following statements:
 - **Commit work.** The updates performed by the transaction become permanent in the database.
 - **Rollback work.** All the updates performed by the SQL statements in the transaction are undone.
- Atomic transaction
 - either fully executed or rolled back as if it never occurred

Integrity Constraints

- Integrity constraints guard against accidental damage to the database, by ensuring that authorized changes to the database do not result in a loss of data consistency.
 - A checking account must have a balance greater than \$10,000.00
 - A salary of a bank employee must be at least \$4 an hour
 - A customer must have a (non-null) phone number

Constraints on a Single Relation

- **not null**
- **primary key**
- **unique**
- **check (P)**, where P is a predicate

Referential Integrity

- Ensures that a value that appears in one relation for a given set of attributes also appears for a certain set of attributes in another relation.

Referential Integrity

- Ensures that a value that appears in one relation for a given set of attributes also appears for a certain set of attributes in another relation.
 - Example: If “Biology” is a department name appearing in one of the tuples in the *instructor* relation, then there exists a tuple in the *department* relation for “Biology”.
- Let A be a set of attributes. Let R and S be two relations that contain attributes A and where A is the primary key of S. A is said to be a **foreign key** of R if for any values of A appearing in R these values also appear in S.

Built-in Data Types in SQL

- **date:** Dates, containing a (4 digit) year, month and date
 - Example: **date** '2005-7-27'
- **time:** Time of day, in hours, minutes and seconds.
 - Example: **time** '09:00:30' **time** '09:00:30.75'
- **timestamp:** date plus time of day
 - Example: **timestamp** '2005-7-27 09:00:30.75'
- **interval:** period of time
 - Example: **interval** '1' day
 - Subtracting a date/time/timestamp value from another gives an interval value
 - Interval values can be added to date/time/timestamp values

User-Defined Types

- **create type** construct in SQL creates user-defined type

```
create type Dollars as numeric (12,2) final
```

- Example:

```
create table department
(dept_name varchar (20),
building varchar (15),
budget Dollars);
```

Authorization

- We may assign a user several forms of authorizations on parts of the database.
 - **Read** - allows reading, but not modification of data.
 - **Insert** - allows insertion of new data, but not modification of existing data.
 - **Update** - allows modification, but not deletion of data.
 - **Delete** - allows deletion of data.
- Each of these types of authorizations is called a **privilege**. We may authorize the user all, none, or a combination of these types of privileges on specified parts of a database, such as a relation or a view.

Authorization (Cont.)

- Forms of authorization to modify the database schema
 - **Index** - allows creation and deletion of indices.
 - **Resources** - allows creation of new relations.
 - **Alteration** - allows addition or deletion of attributes in a relation.
 - **Drop** - allows deletion of relations.

Authorization Specification in SQL

- The **grant** statement is used to confer authorization
grant <privilege list> on <relation or view > to <user list>
- <user list> is:
 - a user-id
 - **public**, which allows all valid users the privilege granted
 - A role (more on this later)
- Example:
 - **grant select on department to Amit, Satoshi**
- Granting a privilege on a view does not imply granting any privileges on the underlying relations.
- The grantor of the privilege must already hold the privilege on the specified item (or be the database administrator).

Privileges in SQL

- **select**: allows read access to relation, or the ability to query using the view
 - Example: grant users U_1 , U_2 , and U_3 **select** authorization on the *instructor* relation:
grant select on instructor to U_1 , U_2 , U_3
- **insert**: the ability to insert tuples
- **update**: the ability to update using the SQL update statement
- **delete**: the ability to delete tuples.
- **all privileges**: used as a short form for all the allowable privileges

Revoking Authorization in SQL

- The **revoke** statement is used to revoke authorization.
revoke <privilege list> on <relation or view> from <user list>
- Example:
revoke select on student from U_1, U_2, U_3
- <privilege-list> may be **all** to revoke all privileges the revoker may hold.
- If <revoker-list> includes **public**, all users lose the privilege except those granted it explicitly.
- If the same privilege was granted twice to the same user by different grantees, the user may retain the privilege after the revocation.

Roles

- A **role** is a way to distinguish among various users as far as what these users can access/update in the database.
- To create a role we use:
create role <name>
- Example:
 - **create role instructor**
- Once a role is created we can assign “users” to the role using:
 - **grant <role> to <users>**

Roles Example

- **create role** instructor;
- **grant** *instructor* **to** Amit;
- Privileges can be granted to roles:
 - **grant select on** *takes* **to** *instructor*;
- Roles can be granted to users, as well as to other roles
 - **create role** *teaching_assistant*
 - **grant** *teaching_assistant* **to** *instructor*;
 - *Instructor* inherits all privileges of *teaching_assistant*

Authorization on Views

Authorization on Views

- **create view geo_instructor as**
(select *
from instructor
where dept_name = 'Geology');
- **grant select on geo_instructor to geo_staff**
